## PHASE I:

1. Fact-Finding Techniques and Information Gathering
   - 1.1 Description Fact-Finding Techniques .......................................................... 3
   - 1.3 Introduction to Enterprise/Organization ......................................................... 3
   - 1.4 Describe entity/relationship sets ..................................................................... 3
   - 1.5 Itemized descriptions of Entity/Relationship Sets ......................................... 3-4
   - 1.6 User Groups, Data views and Operations ....................................................... 4

2. Conceptual Database Design
   - 2.1 Entity Set Descriptions .................................................................................. 4-14
   - 2.2 Relationship Set Descriptions ........................................................................ 14-16
   - 2.3 Related Entity Set .......................................................................................... 14-16
   - 2.4 E-R Diagram .................................................................................................... See Attached

## PHASE 2:

(3.1) E-R Model and Relational Model Descriptions ............................................. 16-18

(3.2) Relational Model (Diagram) ............................................................................ See Attached

(3.3) Relation Instances (Tuples) ............................................................................. 19-25

(3.4/3.5) Queries ........................................................................................................ 25-28

## PHASE 3:

(1) Normalization of Relations ................................................................................ 38-40

## PHASE 4:

A. Common Features in Oracle PL/SQL and MS-Trans-SQL ................................... 40-41

B. Oracle PL/SQL ........................................................................................................ 41-45
1.1 Fact-Finding Techniques:

Employee enters each transaction made into the database. Manager enters employee, inventory, and purchases into the database. The database will generate a monthly income and expense, and inventory reports. In our fact-finding, we contacted various business owners of coffee shops in order to find out their database needs.

1.3 Introduction to Enterprise/Organization:

Coffee shop that sells food/drinks and resupplies inventory from the distributor. We’ve been in business for a number of years and it is becoming difficult to access necessary data in a timely manner. For these reasons we have decided to develop a database in order to better store our company’s information in a more secure and efficient manner.

1.4/ 1.5 Designing a conceptual database to keep records of financial information.

Major Entity Sets:

Supplier: Name, phone number, address.

Inventory: Date/Time, employee who completed the inventory

Inventory information: The ID of every item, total in inventory, amount sold since previous month, amount purchased from previous month, and total amount
unaccounted for.

Item: Name, price per unit, ItemID.

Employee: SSN, name, phone number, address, date hired, pay.

Purchase: TransactionID, Time and Date, Employee's Social, Price and Supplier's name.

Purchase Info: The TransactionID, ItemID and quantity of item bought.

ItemSold: TransactionID, Time and Date, Employee's Social, and price of transaction.

ItemSoldInfo: TransactionID, ItemID and quantity of item bought.

Relationship Sets:

The relationship between the entities Transaction:Supplier is Purchased From. The quantity and price is stored within Purchased From. Transaction:Supplier is a M:M ratio.

The relationship between the entities Transaction:Item is Item Purchased. The quantity and price is stored within Item Purchased. Transaction:Item is a M:M ratio.

The relationship between the entities Sale:Item is Item Sold. The quantity and price is stored within Item Sold. Sale:Item is a M:M ratio.

The relationship between the entities Transaction:Employee is Sold By to distinguish which employee made the sale. Transaction:Employee is a M:M ratio.

The relationship between the entities Employee:Inventory is Completed By to distinguish which employee completed the inventory. Employee:Inventory is a M:M ratio.

1.6 User Groups, Data views and Operations:

The two groups who will use the database are the manager and employee. Manager will have access to every entity and be able to do add, remove, change, and reporting operations. Employees will only have access to the Sale entity and be able to do add operations.

2.1 Entity Set Description
1. Transaction

The purpose of the transaction entity is to keep a record of all purchases and sales made by the business. It will hold data for the date and time of the transaction, the employee who made the purchase or sale, the ID number for the transaction and the supplier if the transaction was a purchase. It will also keep track of whether the transaction was a purchase or a sale.

Attribute Name: Transaction ID

Description: Gives a number to each transaction.

<table>
<thead>
<tr>
<th>Domain/Type</th>
<th>Value-Range</th>
<th>Default Value</th>
<th>Null Value</th>
<th>Unique</th>
<th>Single or Multiple Value</th>
<th>Simple or Composite</th>
</tr>
</thead>
<tbody>
<tr>
<td>Integer</td>
<td>1 - 10,000</td>
<td>Next Integer</td>
<td>Not Allowed</td>
<td>Yes</td>
<td>Single</td>
<td>Simple</td>
</tr>
</tbody>
</table>

Attribute Name: Date/Time

Description: Gives the date and time of each transaction.

<table>
<thead>
<tr>
<th>Domain/Type</th>
<th>Value-Range</th>
<th>Default Value</th>
<th>Null Value</th>
<th>Unique</th>
<th>Single or Multiple Value</th>
<th>Simple or Composite</th>
</tr>
</thead>
</table>
**Attribute Name:** Purchase/Sale

Description: States whether the transaction was a purchase or a sale, denoted by a 1 for sale and a 2 for purchase

<table>
<thead>
<tr>
<th>Domain/Type</th>
<th>Value-Range</th>
<th>Default Value</th>
<th>Null Value</th>
<th>Unique</th>
<th>Single or Multiple Value</th>
<th>Simple or Composite</th>
</tr>
</thead>
<tbody>
<tr>
<td>Integer</td>
<td>1 - 2</td>
<td>1</td>
<td>Not Allowed</td>
<td>No</td>
<td>Single</td>
<td>Simple</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Candidate Keys</th>
<th>Primary Key</th>
<th>Strong/Weak Entity</th>
<th>Fields to be Indexed</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transaction ID</td>
<td>Transaction ID</td>
<td>Strong</td>
<td>Transaction ID</td>
</tr>
</tbody>
</table>

**2. Supplier**

The purpose of the supplier entity is to keep a record of the suppliers the store uses
regularly as well as keep track of which supplier was used for each purchase.

**Attribute Name:** Name

**Description:** The name of the company the store is buying their products from.

<table>
<thead>
<tr>
<th>Domain/Type</th>
<th>Value-Range</th>
<th>Default Value</th>
<th>Null Value</th>
<th>Unique</th>
<th>Single or Multiple Value</th>
<th>Simple or Composite</th>
</tr>
</thead>
<tbody>
<tr>
<td>A character string</td>
<td>A-Z, 0-9 (Length of 20)</td>
<td>' '</td>
<td>Not Allowed</td>
<td>Yes</td>
<td>Single</td>
<td>Simple</td>
</tr>
</tbody>
</table>

**Attribute Name:** Number

**Description:** The phone number of the company the store is buying products from

<table>
<thead>
<tr>
<th>Domain/Type</th>
<th>Value-Range</th>
<th>Default Value</th>
<th>Null Value</th>
<th>Unique</th>
<th>Single or Multiple Value</th>
<th>Simple or Composite</th>
</tr>
</thead>
<tbody>
<tr>
<td>Character string</td>
<td>0-9 (Length of 10)</td>
<td>NULL</td>
<td>Allowed</td>
<td>Yes</td>
<td>Single</td>
<td>Simple</td>
</tr>
</tbody>
</table>
### Attribute Name: Address

Description: The address of the company the store is buying products from.

<table>
<thead>
<tr>
<th>Domain/Type</th>
<th>Value-Range</th>
<th>Default Value</th>
<th>Null Value</th>
<th>Unique</th>
<th>Single or Multiple Value</th>
<th>Simple or Composite</th>
</tr>
</thead>
<tbody>
<tr>
<td>Character string</td>
<td>0 - 9, A - Z (Length 30)</td>
<td>NULL</td>
<td>Allowed</td>
<td>Yes</td>
<td>Single</td>
<td>Simple</td>
</tr>
</tbody>
</table>

#### Candidate Keys

<table>
<thead>
<tr>
<th>Candidate Keys</th>
<th>Primary Key</th>
<th>Strong/Weak Entity</th>
<th>Fields to be Indexed</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name, Number, Address</td>
<td>Name</td>
<td>Strong</td>
<td>Name</td>
</tr>
</tbody>
</table>

### 3.Item

The item entity will keep track of all of the items the coffee shop will sell as well as the ingredients used to make those items they have in their inventory. It has the Attributes Item name, price per unit and total amount of items in the inventory.

#### Attribute Name: Name

Description: The name of the item
<table>
<thead>
<tr>
<th>Domain/Type</th>
<th>Value-Range</th>
<th>Default Value</th>
<th>Null Value</th>
<th>Unique</th>
<th>Single or Multiple Value</th>
<th>Simple or Composite</th>
</tr>
</thead>
<tbody>
<tr>
<td>Character string</td>
<td>0 - 9, A - Z (Length 30)</td>
<td>' '</td>
<td>Not Allowed</td>
<td>Yes</td>
<td>Single</td>
<td>Simple</td>
</tr>
</tbody>
</table>

**Attribute Name:** Price Per Unit  
Description: The total price per unit of the item

<table>
<thead>
<tr>
<th>Domain/Type</th>
<th>Value-Range</th>
<th>Default Value</th>
<th>Null Value</th>
<th>Unique</th>
<th>Single or Multiple Value</th>
<th>Simple or Composite</th>
</tr>
</thead>
<tbody>
<tr>
<td>Decimal (Monetary Value)</td>
<td>$0.00 - $1,000.00</td>
<td>$0.00</td>
<td>Not Allowed</td>
<td>No</td>
<td>Single</td>
<td>Simple</td>
</tr>
</tbody>
</table>

**Attribute Name:** Total Units  
Description: The total amount of the item in inventory updated every inventory
4. Employee

The employee entity is for keeping a record of all employees in the database and their information such as their name, SSN, phone number, address, date hired and pay so that the employer can easily have access to any of this information.

Attribute Name: SSN

Description: The employee's social security number
**Attribute Name:** Fname

Description: The first name of the employee

<table>
<thead>
<tr>
<th>Domain/Type</th>
<th>Value-Range</th>
<th>Default Value</th>
<th>Null Value</th>
<th>Unique</th>
<th>Single or Multiple Value</th>
<th>Simple or Composite</th>
</tr>
</thead>
<tbody>
<tr>
<td>Character String</td>
<td>A-Z (Length of 15)</td>
<td>''</td>
<td>Not Allowed</td>
<td>Yes</td>
<td>Single</td>
<td>Simple</td>
</tr>
</tbody>
</table>

**Attribute Name:** Lname

Description: The last name of the employee

<table>
<thead>
<tr>
<th>Domain/Type</th>
<th>Value-Range</th>
<th>Default Value</th>
<th>Null Value</th>
<th>Unique</th>
<th>Single or Multiple Value</th>
<th>Simple or Composite</th>
</tr>
</thead>
<tbody>
<tr>
<td>Character String</td>
<td>A-Z (Length of 15)</td>
<td>''</td>
<td>Not Allowed</td>
<td>Yes</td>
<td>Single</td>
<td>Simple</td>
</tr>
</tbody>
</table>

**Attribute Name:** Phone Number

Description: The phone number of the employee
<table>
<thead>
<tr>
<th>Domain/Type</th>
<th>Value-Range</th>
<th>Default Value</th>
<th>Null Value</th>
<th>Unique</th>
<th>Single or Multiple Value</th>
<th>Simple or Composite</th>
</tr>
</thead>
<tbody>
<tr>
<td>Character String</td>
<td>0 - 9 (Length of 10)</td>
<td>NULL</td>
<td>Allowed</td>
<td>Yes</td>
<td>Single</td>
<td>Simple</td>
</tr>
</tbody>
</table>

**Attribute Name:** Address

Description: The address of the employee

<table>
<thead>
<tr>
<th>Domain/Type</th>
<th>Value-Range</th>
<th>Default Value</th>
<th>Null Value</th>
<th>Unique</th>
<th>Single or Multiple Value</th>
<th>Simple or Composite</th>
</tr>
</thead>
<tbody>
<tr>
<td>Character String</td>
<td>0 - 9, A - Z (Length of 30)</td>
<td>NULL</td>
<td>Allowed</td>
<td>Yes</td>
<td>Single</td>
<td>Simple</td>
</tr>
</tbody>
</table>

**Attribute Name:** Date Hired

Description: The date the employee was hired
<table>
<thead>
<tr>
<th>Domain/Type</th>
<th>Value-Range</th>
<th>Default Value</th>
<th>Null Value</th>
<th>Unique</th>
<th>Single or Multiple Value</th>
<th>Simple or Composite</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date</td>
<td>Time and Date</td>
<td>Current Date</td>
<td>Not Allowed</td>
<td>No</td>
<td>Single</td>
<td>Simple</td>
</tr>
</tbody>
</table>

**Attribute Name:** Pay

**Description:** The employee's pay

<table>
<thead>
<tr>
<th>Domain/Type</th>
<th>Value-Range</th>
<th>Default Value</th>
<th>Null Value</th>
<th>Unique</th>
<th>Single or Multiple Value</th>
<th>Simple or Composite</th>
</tr>
</thead>
<tbody>
<tr>
<td>Decimal (Monetary Value)</td>
<td>$8.00 - $20.00</td>
<td>$8.00</td>
<td>Not Allowed</td>
<td>No</td>
<td>Single</td>
<td>Simple</td>
</tr>
</tbody>
</table>

**Candidate Keys**

<table>
<thead>
<tr>
<th>Candidate Keys</th>
<th>Primary Key</th>
<th>Strong/Weak Entity</th>
<th>Fields to be Indexed</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fname, Lname, SSN</td>
<td>SSN</td>
<td>Strong</td>
<td>SSN</td>
</tr>
</tbody>
</table>
5. Inventory

The inventory entity's purpose is to provide the company with a way to make an inventory every month/week etc. They can then use the data to compare with previous inventories to find out how much loss they experienced in that time period. It will accomplish this by having a field for the date as well as a field for all of the items.

Attribute Name: Date

Description: The date the inventory was completed

<table>
<thead>
<tr>
<th>Domain/Type</th>
<th>Value-Range</th>
<th>Default Value</th>
<th>Null Value</th>
<th>Unique</th>
<th>Single or Multiple Value</th>
<th>Simple or Composite</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date</td>
<td>Time and Date</td>
<td>Current Date</td>
<td>Not Allowed</td>
<td>Yes</td>
<td>Single</td>
<td>Simple</td>
</tr>
</tbody>
</table>

Attribute Name: Items

Description: The total units and names for all items in inventory
### 3.Item

The item entity will keep track of all of the items the coffee shop will sell as well as the ingredients used to make those items they have in their inventory. It has the Attributes Item name, price per unit and itemID.

**Attribute Name:** Name

**Description:** The name of the item
### Attribute Name: Price Per Unit

**Description:** The total price per unit of the item

<table>
<thead>
<tr>
<th>Domain/Type</th>
<th>Value-Range</th>
<th>Default Value</th>
<th>Null Value</th>
<th>Unique</th>
<th>Single or Multiple Value</th>
<th>Simple or Composite</th>
</tr>
</thead>
<tbody>
<tr>
<td>Decimal (Monetary Value)</td>
<td>$0.00 - $1,000.00</td>
<td>$0.00</td>
<td>Not Allowed</td>
<td>No</td>
<td>Single</td>
<td>Simple</td>
</tr>
</tbody>
</table>

### Attribute Name: ItemID

**Description:** The ID number of every item we have inventoried.
<table>
<thead>
<tr>
<th>Domain/Type</th>
<th>Value-Range</th>
<th>Default Value</th>
<th>Null Value</th>
<th>Unique</th>
<th>Single or Multiple Value</th>
<th>Simple or Composite</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number(9)</td>
<td>A nine digit number</td>
<td>0</td>
<td>Not Allowed</td>
<td>Yes</td>
<td>Single</td>
<td>Simple</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Candidate Keys</th>
<th>Primary Key</th>
<th>Strong/Weak Entity</th>
<th>Fields to be Indexed</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name</td>
<td>Weak</td>
<td>Name</td>
</tr>
</tbody>
</table>

4. **Employee**

The employee entity is for keeping a record of all employees in the database and their information such as their name, SSN, phone number, address, date hired and pay so that the employer can easily have access to any of this information.

**Attribute Name:** SSN

Description: The employee's social security number
<table>
<thead>
<tr>
<th>Domain/Type</th>
<th>Value-Range</th>
<th>Default Value</th>
<th>Null Value</th>
<th>Unique</th>
<th>Single or Multiple Value</th>
<th>Simple or Composite</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number(9)</td>
<td>0 - 9</td>
<td>0000000000</td>

</tr>
</tbody>
</table>

**PHASE 2:**

(3.1) E-R Model and Relational Model

Conceptual modeling is a very important phase in designing a successful database application. Generally, the term database application refers to a particular database and the associated programs that implement the database queries and updates. These programs provide user-friendly graphical user interfaces (GUIs) utilizing forms and menus for the end users of the application. A major part of the database application will require the design, implementation, and testing of these application programs.

The Entity-Relationship (ER) model is a popular high-level conceptual data model. This model is frequently used for the conceptual design of database applications. Also used to create an ER-Diagram of your conceptual database using various entity types, sets, keys, and attributes.

The relational data model was first introduced by Ted Codd of IBM research in 1970, and it attracted immediate attention due to its simplicity and mathematical foundation. The model uses the concept of a mathematical relation -- which looks somewhat like a table of values -- as its basic building block, and has its theoretical basis in set theory and first-order predicate logic. SQL query language is the standard for commercial relational DBMSs. Relational Algebra and relational calculus are two formal languages associated with the relational model. The relational calculus is considered to be the basis for the SQL language, and the relational algebra is used in the internals of many database implementations for query processing and optimization.

<table>
<thead>
<tr>
<th>ER MODEL</th>
<th>RELATIONAL MODEL</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Entity type</strong></td>
<td><strong>Entity Relation</strong></td>
</tr>
<tr>
<td><strong>1:1 or 1:N relationship type</strong></td>
<td>Foreign key (or relationship relation)</td>
</tr>
<tr>
<td><strong>M:N relationship type</strong></td>
<td>Relationship relation and two foreign keys</td>
</tr>
<tr>
<td><strong>n-ary relationship type</strong></td>
<td>Relationship relation and n foreign keys</td>
</tr>
<tr>
<td><strong>Simple Attribute</strong></td>
<td><strong>Attribute</strong></td>
</tr>
<tr>
<td><strong>Composite Attribute</strong></td>
<td>Set of simple component attributes</td>
</tr>
<tr>
<td><strong>Multivalued Attribute</strong></td>
<td>Relation and foreign key</td>
</tr>
<tr>
<td>Value Set</td>
<td>Domain</td>
</tr>
<tr>
<td>----------</td>
<td>----------------</td>
</tr>
<tr>
<td><strong>Key Attribute</strong></td>
<td>Primary (or secondary) key</td>
</tr>
</tbody>
</table>

In order to convert an Entity-Relationship model into a Relational model you must follow this 7 step algorithm:

- **Step 1**: Mapping of Regular Entity Types
- **Step 2**: Mapping of Weak Entity Types
- **Step 3**: Mapping of Binary 1:1 Relationship Types
- **Step 4**: Mapping of Binary 1:N Relationship Types
- **Step 5**: Mapping of Binary M:N Relationship Types
- **Step 6**: Mapping of Multivalued Attributes
- **Step 7**: Mapping of N-ary Relationship Types

**Conversion Issues:**

For each strong entity type E in the ER schema, create a relation R that includes all the simple attributes of E. Include only the simple component attributes of a composite attribute. Choose one of the key attributes of E as the primary key for R. If the chosen key of E is a composite, then the set of simple attributes that form it together will form the primary key of R.

For each weak entity type W in the ER schema with owner entity type E, create a relation R and include all simple attributes of W as attributes of R. In addition, include as foreign key attributes of R, the primary key attribute(s) of the relation(s) that correspond to the owner entity type(s); this takes care of mapping the indentifying relationship type of W. The primary key of R is the combination of the primary key(s) of the owner(s) and the partial key of the weak entity type W, if any.

**Constraints:**

A referential constraint is usually used in the context of relationships and asserts that exactly one value exists in a given context. If R is a (M:1 or 1:1) relationship from E to F, we require that the entity in F related by R to an entity in E must exist.

A entity constraint is a constraint placed on an entity in how it relates to another entity.

A primary key constraint is a rule that says that the primary key fields cannot be null and cannot contain duplicate data.

A foreign key constraint specifies that the data in a foreign key must match the data in the primary key of the linked table.

### (3.4/3.5) Queries

1. **The most expensive purchase from a supplier.**

   **Relational Algebra:**
   
   ```
   \text{PROJECT} \ (\text{Purchase}(p) - (\text{Purchase}(p1) \ JOIN \ \text{Purchase}(p2)))
   
   p.\ast
   
   (p1.Sname = p2.Sname \wedge p1.price < p2.price)
   ```

   **Tuple Calculus:**
   
   \[
   \{ \ p.\ast \mid (\Ep)\text{purchase}(p) \wedge \neg((\Ep2)\text{purchase}(p2) \wedge (p2 > p1)) \}
   \]

   **Domain Calculus:**
   
   \[
   \{<q,t,p,s,i> \mid \text{purchase}(q,t,p,s,i) \wedge (\Ep)(\text{purchase}(\_ ,t,p,\_ ,\_)) \wedge \neg (\Ep2)(\text{purchase}<_t,p,\_ ,\_ ) \wedge (p2 > p1)\}
   \]

2. **All Employees who made no sales last week.**

   **Relational Algebra:**
   
   ```
   \text{PROJECT} (\text{Employee}(e) - \text{PROJECT}(\text{Employee}(e1) \ JOIN \ \text{Transaction}))
   
   e.\ast
   
   e1.\ast
   
   (SSN = ESSN \wedge \text{date} > 10/7/2011 \wedge \text{date} < 10/14/2011)
   ```

   **Tuple Calculus:**
   
   **Domain Calculus:**
   
   \[
   \{<s,n,ph,a,d,p> \mid \text{employee}(s,n,ph,a,d,p) \wedge \neg((\Es)\text{employee}(s,\_ ,\_ ,\_ ,\_ ,\_ ) \wedge (\Ee)\text{transaction}(\_ ,d,\_ ,\_ ) \wedge s = e \wedge (d > 8/31/1011 \wedge d < 10/1/2011))\}
   \]
\{e,* \mid (Ee)employee(e) \land NOT((Et)transaction(t) \land e.SSN = t.ESSN \land t.date > 8/31/2011 \land t.date < 10/01/2011)\} \\

3. Suppliers we have bought every item from at least once.

Relational Algebra:

\textbf{PROJECT} (Purchase) \setminus \textbf{PROJECT} (Item) \\
Sname, ItemID ItemID

Tuple Calculus:

\{s,* \mid (Es)supplier(s) \land NOT((Ep)purchase(p) \land (Ei)item(i) \land i.ItemID \neq p.IID)\}

Domain Calculus:

\{<n,p,a> \mid supplier(n,p,a) \land NOT((Ei)purchase(_,_,_,s,i) \land (Ei2)item(i2,_,_,_,_,_,_) \land i \neq i2)\}

4. Most popular item in inventory last month.

Relational Algebra:

\textbf{PROJECT} (Inventory(in) \setminus (Item \textbf{NATURAL JOIN} (Inventory(I1) \textbf{JOIN} Inventory(I2)))) Item.* \\
(I1.date > 8/31/2011 \land I1.date < 10/1/2011 \land I2.date > 8/31/2011 \land I2.date < 10/1/2011 \land I1.soldsincelast < I2.soldsincelast)

Tuple Calculus:

\{i,* \mid item(i) \land inventory(y) \land y.date >= 10/1/2011 \land y.date <= 10/31/2011 \land NOT(inventory(y2) \land y2.sold > y.sold \land (y2.date >= 10/1/2011 \land y2.date <= 10/31/2011))\}

Domain Calculus:

\{<n,i,p> \mid item(n,i,p) \land ((Es)inventory(i,_,_,s,d,_,_) \land d >= 10/01/2011 \land d <= 10/31/2011) \land NOT((Es2)inventory(i,_,_,s2,d2,_,_) \land s2 > s \land (d2 >= 10/01/2011 \land d2 <= 10/31/2011))\}

5. Smallest number of items purchased in one transaction.

Relational Algebra:

\textbf{PROJECT} (Purchase(p) \setminus (Purchase(p1) \textbf{JOIN} Purchase(p2)))
p.quantity                                                     p1.quantity > p2.quantity

Tuple Calculus:

\{p.quantity \mid (Ep)\text{purchase}(p) \land (Ep2)\text{purchase}(p2) \land \text{NOT)((Ep3)\text{purchase}(p3) \land p3.quantity < p2.quantity)}\}

Domain Calculus:

\{<q> \mid \text{purchase}(q,t,p,s,i) \land (Eq)\text{(purchase}(q,t,\_\_\_\_\_)) \land \text{NOT}((Eq2)(\text{purchase}(q,\_\_\_\_\_)) \land q2 > q1)\}

6. All employees who make exactly ten dollars an hour.

Relational Algebra:

\text{PROJECT} (\text{Employee}) / $10.00
\text{name, pay}

Tuple Calculus:

\{e.* \mid (Ee)\text{employee}(e) \land e.pay = $10.00\}

Domain Calculus:

\{<s,n,ph,a,d,p> \mid \text{employee}(s,n,ph,a,d,p) \land ((Ep)\text{employee}(\_\_\_\_\_\_\_) \land p = $10.00)\}

7. The second largest amount of money made in one sale

Relational Algebra:

\text{AllButLargest} \leq (\text{Sale}(s1) \text{JOIN} \text{Sale}(s2))
\text{s1.price < s2.price}

\text{PROJECT} (\text{AllButLargest}(a) - (\text{AllButLargest}(a1) \text{JOIN} \text{AllButLargest}(a2)))
\text{a.price} \leq \text{a1.price < a2.price}

Tuple Calculus:

\{s2.price \mid (Es)\text{sale}(s) \land (Es2)\text{sale}(s2) \land s2.price < s.price \land \text{NOT}((Es3)\text{sale}(s3) \land (s3.price < s.price)
\land (s3.price != s2.price))\}

Domain Calculus:

\{<p,t> \mid \text{sale}(i,q,p,t) \land (Ep)\text{sale}(\_\_\_\_\_,\_\_\_\_) \land (Ep2)\text{sale}(\_\_\_\_,p2,t) \land p2 < p \land \text{NOT}(Ep3)\text{sale}(\_\_\_\_,p3,\_\_)\}
\( (p3 < p) \land (p3 \neq p2) \)

8. The average price per sale last month.

Relational Algebra:

\[
\text{PROJECT (AGGREGATE (SELECT (Transaction X Sale)))}
\]

\[
\begin{align*}
\text{price} & \quad \text{AVERAGE Price} \\
\text{date} & > 8/31/2011 \land \text{date} < 10/01/2011
\end{align*}
\]

Tuple Calculus:

\[
\{ \text{AGGREGATE Aggregate s.price } | (\text{Es})\text{sale(s) } \land (\text{Et})\text{transaction(t) } \land \text{t.date} > 8/31/2011 \land \\
\text{t.date} < 10/01/2011 \land \text{t.ID} = \text{s.TID} \}
\]

Domain Calculus:

\[
\{ \langle \text{AGGREGATE Average p} > | \text{sale(_,_,p,t) } \land ((\text{Ed})\text{transaction(i,d,_,_) } \land \\
\text{d} > 8/31/2011 \land \text{d} < 10/01/2011 \land \text{t} = \text{i}) \}
\]

**PHASE 3:**

1. Normalization of Relations

(1)

A.

The First Normal Form (1NF) was historically defined to disallow multivalued attributes, composite attributes, and their combinations. It states that the domain of an attribute must include only atomic (simple, indivisible) values and that the value of any attribute in a tuple must be a single value from the domain of that attribute. In other words, 1NF disallows relations within relations or relations as attribute values within tuples.

The Second Normal Form (2NF) is based on the concept of full functional dependency. A functional dependency \( X \rightarrow Y \) is a full functional dependency if removal of any attribute \( A \) from \( X \) means that the dependency does not hold any more. A functional dependency \( X \rightarrow Y \) is a partial dependency if some attribute \( A \in X \) can be removed from \( X \) and the dependency still holds. **Definition:** A relation schema \( R \) is in 2NF if every nonprime attribute \( A \) in \( R \) is fully functionally dependent on the primary key of \( R \).

The Third Normal Form (3NF) is based on the concept of transitive dependency. A functional dependency \( X \rightarrow Y \) in a relation schema \( R \) is a transitive dependency if there exists a set of attributes \( Z \) in \( R \) that is neither a candidate key nor a subset of any key of \( R \), and both \( X \rightarrow Z \) and \( Z \rightarrow Y \) hold.
**Definition:** According to Codd's original definition, a relation schema R is in 3NF if it satisfies 2NF and no nonprime attribute of R is transitively dependent on the primary key.

Boyce-Codd normal form (BCNF) was proposed as a simpler form of 3NF, but it was found to be stricter than 3NF. That is, every relation in BCNF is also in 3NF; however, a relation in 3NF is not necessarily in BCNF. **Definition:** A relation schema R is in BCNF if whenever a nontrivial functional dependency X → Y holds in R, then X is a superkey of R.

**B.**

Storing natural joins of base relations leads to an additional problem referred to as update anomalies. These can be classified into insertion anomalies, deletion anomalies, and modification anomalies.

**Insertion Anomalies:** Place Null values where the primary key is not allowed.

**Deletion Anomalies:** If you delete a row from a table that information is lost from the database.

**Modification Anomalies:** If you change an attribute in one row you must update that whole row or the information will become inconsistent.

(2)

A. Which normal forms are the relations in?

<table>
<thead>
<tr>
<th>Relation</th>
<th>Normal Form</th>
</tr>
</thead>
<tbody>
<tr>
<td>Employee</td>
<td>First normal form (1NF)</td>
</tr>
<tr>
<td>Supplier</td>
<td>First normal form (1NF)</td>
</tr>
<tr>
<td>Item</td>
<td>2nd normal form (2NF)</td>
</tr>
<tr>
<td>Inventory</td>
<td>2nd normal form (2NF)</td>
</tr>
<tr>
<td>Inventory Info</td>
<td>2nd normal form (2NF)</td>
</tr>
<tr>
<td>Item Sold</td>
<td>2nd normal form (2NF)</td>
</tr>
<tr>
<td>Item Sold Info</td>
<td>2nd normal form (2NF)</td>
</tr>
<tr>
<td>Purchase</td>
<td>2nd normal form (2NF)</td>
</tr>
<tr>
<td>Purchase Info</td>
<td>2nd normal form (2NF)</td>
</tr>
</tbody>
</table>

B. Do any modification anomalies exist?

Yes, there will be Deletion/Modification anomalies when the Item Id attribute from the relation Item becomes deleted. Thus losing the info in the relations ItemSold Info and Purchase Info. Delete the ESSN from employee and Inventory/Item Sold/Purchase results in a loss of info. If the Date/Time is deleted in Inventory then that info will be lost in Inventory Info. Same goes for the attribute TID.
SQL * Plus: an Oracle command-line utility program that can run SQL and PL/SQL commands interactively or from a script. SQL*Plus operates as a relatively simple tool with a basic command-line interface. Programmers and DBAs commonly use it as the default available fundamental interface in almost any Oracle Software installation.

A schema is a collection of logical structures of data, or schema objects. A schema is owned by a database user and has the same name as that user. Each user owns a single schema. Schema objects can be created and manipulated with SQL and include the following types of objects: Tables, Views, Indexes, and Clusters. Tables are the basic unit of data storage in an Oracle database. Data is stored in rows and columns. A view is a tailored presentation of the data contained in one or more tables or other views. A view takes the output of a query and treats it as a table. Therefore, a view can be thought of as a stored query or a virtual table. You can use views in most places where a table can be used.

PHASE 4:

A. Common Features in Oracle PL/SQL and MS Trans-SQL

(1) Components which consist of PL/SQL and Trans-SQL:

A Oracle PL/SQL is a block structured language in which functions, procedures and anonymous blocks are the basic blocks. Blocks can be defined with another block.

A block consists of three parts:
- Declaration: declare variables, constraints, cursors, and user-defined expressions.
- Executable: consists of SQL/SQLPLUS statements.
- Exception Handling: A predefined or user-defined warning or error handled by the PL/SQL program.

(2) Purposes of Stored subprograms:

A stored procedure is a subroutine available to applications that access a relational database system. A stored procedure is stored by the DBMS in the server. They are typically used to process data validation or access control mechanisms. Also, stored procedures can consolidate and centralize logic that was originally implemented in applications. Furthermore, stored procedures can receive variables, return results or modify variables and return them, depending on how and where the variable is declared.

(3) Benefits of calling stored subprogram over sending a dynamic SQL to front-end DBMS server:
• If a database program is needed by several applications, it can be stored at the server and invoked by any of the application programs. This reduces duplication of effort and improves software modularity.
• Executing a program at the server can reduce data transfer and communication cost between the client and server in certain situations.
• These procedures can enhance the modeling power provided by views by allowing more complex types of derived data to be made available to the database users. Additionally, they can be used to check for complex constraints that are beyond the specification power of assertions and triggers.

When comparing it with dynamic SQL a stored program will remove overhead, avoid network traffic, protection against SQL injection attacks, delegation of access-rights, and encapsulation of business logic.

B. Oracle PL/SQL

(1) PL/SQL program structure, control statements, cursors:

• **PL/SQL program structure:**

  A program structure is a block that consists of three parts:

  1. **Declaration:** declare variables, constraints, cursors, and use-defined expressions.
  2. **Executable:** consists of SQL/SQLPLUS statements.
  3. **Exception Handling:** A predefined or user-defined warning or error handled by the PL/SQL program.

• **Control statement:** Consists of conditional, iterative, and sequential controls.

  ➢ **Conditional Controls:**

    ```sql
    If condition THEN
        Statements;
    END IF
    IF condition THEN
        Statements;
    ELSEIF condition THEN
        Statements;
    ELSE
        Statements;
    END IF;
    EXIT-WHEN condition;
    ```
Iterative Controls:

```
LOOP
  Statements;
END LOOP;
FOR I IN lowerbound .. upperbound LOOP
  Statements;
END LOOP;
FOR cursor_variable IN cursor_name LOOP
  Statements;
END LOOP;
WHILE condition LOOP
  Statements;
END LOOP;
```

Sequential Control:

```
GOTO label;
<<label>>
```

- Cursors:

Cursors are used by database programmers to process individual rows returned by database system queries. Cursors enable manipulation of whole result sets at once—a capability that most procedural programming languages lack. In this scenario, a cursor enables the rows in a result-set to be processed sequentially.

Syntax:

```
DECLARE

CURSOR cursor_name [ (parameter_name TYPE [, parameter_name TYPE])] IS select_statement;
```

(2) What is a stored procedure and syntax of creating a stored procedure:

A stored procedure is a saved section of code which handles a specific task which must be repeated regularly. It is similar to a function in a procedural language such as C. The syntax for creating a stored procedure is:

```
CREATE [OR REPLACE] PROCEDURE procedure_name ( [parameters] )
IS
```
What is a stored function and Syntax of creating a stored function:
A stored function is similar to a stored procedure except that it returns a value where a procedure does not. The syntax for creating a function is:

```sql
CREATE [OR REPLACE] FUNCTION function_name ( [parameters] ) 
RETURN 
[specify datatype to return] 
IS 
[declare any variables] 
BEGIN 
[enter procedural code] 
EXCEPTION 
[handle any exceptions] 
END;
```

What is a package and Syntax of creating a package:
A package in PL/SQL is a schema object which contains many different types, procedures, functions etc which can then be shared by many users who may need them for various different applications within the same company. The syntax for a package is:

```sql
CREATE [OR REPLACE] PACKAGE package_name
```
(5) What is a trigger and Syntax of creating a trigger:

A trigger in PL/SQL is a section of code that is executed when a statement such as delete or update is inserted. It is automatically done when the statement is executed. The syntax for a trigger is:

```
CREATE [OR REPLACE ] TRIGGER trigger_name

{BEFORE | AFTER | INSTEAD OF }
```
C. Code and Documentation

Procedure for inserting an employee:

```
create or replace procedure ddjo_addemployee( p_ssn in number, p_name in varchar2,
    p_phone in number, p_address in varchar2, p_hdate in date, p_pay in number) as
begin
    insert into ddjo_employee values(p_ssn, p_name, p_phone, p_address, p_hdate, p_pay);
exception
    when others then
        raise_application_error( -40001, 'An error occurred in ' || sqlcode ||
            'ERROR-: ' || sqlerrm );
end ddjo_addemployee;
/```
Procedure for deleting a supplier:

create or replace procedure ddjo_deletesupplier (supname in varchar2) is

begin

    delete from ddjo_supplier where name = supname;

exception

    when others then

        raise_application_error(-40001, 'An error occurred in ' || sqlcode

        || '-ERROR-' || sqlerrm);

end ddjo_deletesupplier;
/

Function to return average purchase price:

create or replace function ddjo_avgPrice (n in number) return number is

    s number(9, 2) := 0.0;

    p number(7, 2);

    cursor c1 is select price from ddjo_purchase order by price desc;

begin
open c1;
for i in 1 .. n loop
    fetch c1 into p;
    s := s + p;
end loop;
close c1;
return s / n;

exception
when others then
    raise_application_error(-40001, 'An error occurred in ' || sqlcode ||
        '-ERROR-' || sqlerrm);
end;
Trigger to be fired on deletion of employee:

create or replace trigger ddjo_deleteEmployee

before update or delete on ddjo_employee

for each row

begin

insert into ddjo_logtable

values (to_char(:old.ssn) || ' ' || to_char(:old.name) || ' ' ||

        to_char(:old.phone#) || ' ' || to_char(:old.address) || ' ' ||

        to_char(:old.date_hired) || ' ' || to_char(:old.pay)

 ,to_char(:new.ssn) || ' ' || to_char(:new.name) || ' ' ||

        to_char(:new.phone#) || ' ' || to_char(:new.address) || ' ' ||

        to_char(:new.date_hired) || ' ' || to_char(:new.pay) );

exception

when others then

    raise_application_error( -40001, 'An error occurred in ' || sqlcode

    || '-ERROR-' || sqlerrm );
end ddjo_deleteEmployee;

/

**PHASE 5:**

A. Description of Daily activities of the user group.

In our DBMS, the manager will be the only user group of the Coffee Shop. The manager will be able to perform the following functionalities: add, delete, or update tables/reports from any of the following tabs: employee, item, supplier, inventory, purchase, and sales.

B. Relations, views and subprograms related to the activities:

```sql
CREATE TABLE ddjo_employee(
    SSN NUMBER(9) not null,
    NAME VARCHAR2(30) not null,
    phone# varchar2(10) not null,
    address varchar(30) not null,
    date_hired date not null,
    pay number not null,
    CONSTRAINT pk_employee PRIMARY KEY(SSN)
)
PCTfree 5
PCTUSED 15
TABLESPACE cs342index
/
```

```sql
create table ddjo_inventoryinfo(
    ItemID number(9),
    Total number,
    PurchasedSinceLast number,
    SoldSinceLast number,
    unaccountedfor number,
    period date,
    CONSTRAINT fk_inventory_item FOREIGN KEY (itemID) REFERENCES ddjo_item(itemID),
    CONSTRAINT fk_inventory_info FOREIGN KEY (period) REFERENCES ddjo_inventory(period)
)
PCTFree 5
PCTUSED 15
TABLESPACE cs342index
/
```
create table ddjo_inventory(
    period date,
    ESSN number(9),
    CONSTRAINT pk_inventory PRIMARY KEY(period),
    CONSTRAINT fk_inventory_employee FOREIGN KEY (ESSN) REFERENCES ddjo_employee(SSN)
)
PCTFree 5
PCTUSED 15
TABLESPACE cs342index
/

create table ddjo_itemsoldinfo(
    TID number(9),
    quantity number,
    itemID number(9),

C. Screen shots of our Menu Display/Descriptions of the screen shots:

This the Suppliers tab of our GUI where you can add/delete suppliers from the Database.
This is the Employee tab where you can add/delete Employees from the database.
This is the Purchase tab, where you can make purchases/delete purchase info from the database.
This is the Sales tab, where you can add new sale/delete sale info from the database.
This is the Inventory Tab, where you can enter inventory information/delete from the Database.
This is the Items tab, where you can add/delete items from the Database.
This is the Inventory Information tab, where you insert new inventory information.
This is the Sale Information tab, where you insert new sales.
This is the Purchase Info tab, where you can

D. Description of our Code:

2. Descriptions of major classes: We do not have most of the classes asked for in phase 5 because we were not able to establish a connection on Microsoft Visual Studios 2010 to the Oracle Database, so we added Oracle as a datasource.

3. Major features of our GUI program:

   Our GUI program features a single form with 6 different tabs: supplier, employee, item, inventory, purchase, and sales. Then we have 3 other forms with a single tab: sale info, purchase info, and inventory info. Users can reload data by clicking on the data grid.
4. Studied a C# book in order to learn more about Microsoft Visual Studio and C# language.

E. /D(1.)/ Major steps of designing and implementing a database application:

In 6 Phases:

*Phase 1:* Requirements Collection and Analysis: Analyze the expectations of the users and the intended uses of the database in as much detail as possible.

*Phase 2:* Conceptual Database Design: Examine the data requirements resulting from Phase 1 and produce a conceptual database schema.

*Phase 3:* Choice of a DBMS

*Phase 4:* Logical Database Design (Data Model Mapping): Create a conceptual schema and external schemas in the data model of the selected DBMS by mapping those schemas produced in Phase 2. The result of this phase should be DDL (data definition language) statements in the language of the chosen DBMS that specify the conceptual and external level schemas of the database system.

*Phase 5:* Physical Database Design: The process of choosing specific file storage structures and access paths for the database files to achieve good performance for the various database applications.

*Phase 6:* Database System Implementation and Tuning: Language statements in the DDL, including the SDL of the selected DBMS, are compiled and used to create the database schemas and database files. The database can then be loaded (populated with the data). If data is to be converted from an earlier computerized system, conversion routines may be needed to reformat the data for loading in the new database.
