Final Project Proposal

For my final project I want to create an interface that would be used by people that help the less fortunate. For example non-profit organizations that feed the homeless or organizations that give medical care for those that cannot afford it. The website will have a home page that prompts the user to log in. The user will be an agent of an organization. The login/logout system will be handled using sessions. Once the agent logs in they will be able to see the multiple pages of the site. One of the pages will be the “add” page where the agent can add a client (less fortunate person) to the database. The point here is that if the client is in the database it will be easier for them to receive the services provided by the organizations. Another page that will be visible is the “agents” page. The agents page shows all the other organizations in the system so that it will facilitate telling clients where other services they need are offered. When an organization is clicked, a map will open showing directions to the place. I will try to implement google's maps system for this functionality. The final page that will be visible is the client verification page. If the client says he/she is in the system, it will return their details and all their history so that medical care givers/social workers know whats going on.
