Final Project Proposal

For my final project, I was hoping to implement a photo viewing/editing website. The website will be modeled after existing social media services. The purpose of the website will be to allow users a place to view, make comments on, and make small changes to the photos hosted on the site.

It's very easy to make an aesthetically pleasing site using just black/white/gray (Apple, Lush, Vice, etc.), so the overall style of my site will include a very liberal use of color, something I haven't done much in the past. It will include a horizontal navigation bar below the title and will need about 5 pages: A welcome/About page, a gallery page, an image page to demonstrate the options available for images, a contact us page, and a mock profile page.

The site will be very similar to existing social media sites but will be different in that the images can be edited as well as viewed. Users will be able to add comments to the image as well. These changes will be temporary and will not permanently affect the HTML of the program. It will strictly be a demonstration for adding dynamic elements, but I'll make the changes permanent if I find a way.

Overall, I think these options should be enough for my final project. More features may be added but the framework of the project is going to be based on the outline above.
